

After a long, cold, snowy winter, it is finally Daylight Saving Time. But longer days and increasing temperatures can wreak havoc with a poorly maintained HVAC system. You need to make sure your facilities are prepared for the summer with comprehensive Preventive Maintenance.

For your HVAC system to operate at peak efficiency, it is critical that you schedule routine Preventive Maintenance with a qualified commercial HVAC provider that uses highly-skilled technicians with the technical expertise required for today's equipment.

Every business and every facility is unique, but they all require periodic routine maintenance to guarantee optimum performance, energy efficiency and minimize the risk of failure. Use this checklist as a starting point for your Preventive Maintenance to discuss with your provider:

1. Change air filters and check belts
2. Check drain pans and condensate lines and cleared of obstructions
3. Check refrigerant level and recharge if needed
4. Clean ignition system
5. Inspect compressor
6. Inspect fan motor blades
7. Inspect blower assembly
8. Inspect ignition system
9. Inspect heat exchanger
10. Inspect coil and cabinet and clean as needed

Stay cool and comfortable this summer...with the expert help of Carey's Heating and Air Conditioning.
