

ARCHITECTS & ENGINEERS

PCS application engineers can develop designs that cut installation costs

Premier Compaction Systems provides service for all phases of the waste equipment industry

Premier Compaction Systems (PCS) is currently providing expert service for all phases of the waste equipment industry in New Jersey, New York, Connecticut, and Northeastern Pennsylvania region. The current PCS client base consists of retail, manufacturing, condo/apartment complexes, distribution, pharmaceutical, packaging, schools, hospitals, municipals (Departments of Public Works), supermarkets, and nursing homes. PCS has on staff repair experts, preventative maintenance special-

ists, metal fabricators, installation and design engineers. PCS application engineers can develop a design that can save your budget in installation costs as well as future repairs and maintenance. PCS is the only New Jersey Waste Compactor Company that handles residential chutes, compactors and balers with commercial companies.

PCS has installed the Nextraq System to set us apart from any competition in the NY-NJ area. We have expanded our fleet of service vehicles to meet the needs of a growing

client base. PCS has the ability to provide prompt service and repairs that do not require a second and sometimes third visit. PCS will provide an in-depth overview of the equipment being serviced while our technician is on site. This valuable service provided to our clients has saved thousands in avoided future repair costs. The Nextraq system allows PCS to give prompt attention to emergency service calls.

PCS has implemented an oversight system that gives our HR department a clear snapshot of our service tech's

performance. Based on their completed projects and service calls, PCS awards the employee with bonuses, paid time off, and sporting event tickets for the family. PCS recently completed several installs that finished under budget and included quality workmanship that exceeds industry standards. PCS Senior Technicians train service techs as well as shop fabricators. PCS manufactures the interior residential compactors and maintains the Exclusive Rights to the LINE OF COMPACTORS. Our fleet of

service vehicles can provide on-site welding and fabrication. Trash chute cleaning is a service recently added to our portfolio, along with both trash and linen chute design and installation.

PCS has completed 117 new installations for residential and 47 commercial since 2013. PCS maintains a full inventory of parts and related equipment within the PCS shop as well as in our service vehicles. Currently, PCS is developing a management program what will bar code all stock parts and equipment. The bar code system will also be implemented for all our compactors and balers in the field. This will expedite the response time for our clients, and better manage the inventory. All service techs will have their own I-Pads to insure quality control in field service. This system will also increase office inventory and maintain the highest level of service for our clients.

As humans have begun to learn that our ecosystem is a fragile organism, capable of damage we previously believed to be repairable, we must recognize and create solutions to the impact we are affecting on our planet. Years ago we simply "recycled" those items we knew to be recyclable, currently we need to find better ways to manage our recycling efforts, so "Sustainability" became the new key effort to protecting our environment. Recycling has become "Sustainability", and will have lasting effects that will drive to protect the beauty of our environment. The largest impact on the planet inevitably comes from use of our resources without an outlined design for the output. While it is unrealistic to expect that one model will work for every type of business, there must be companies that can study the underlying problems that companies encounter while attempting to become sustainable, and create technologies that help maintain those processes. Through trade-marked systems and database tracking, sustainability can become a natural part of any business' profile once a solid program has been designed and executed. Recycling longevity leads to sustainability which provides long-term savings, reduced carbon footprint impact,
