

St. Michael's Church    Georgiaville, RI

25 September 2013

To Whom It May Concern:

During the summer of 2013, the parish contracted to have a shingle roof replaced. The roof had been in place since 1981. In the process, it appeared that asbestos materials might have been used under the singles.

We called upon Atlantic Abatement to investigate this further. Atlantic sent workers to the church and did sampling all over the roof area. It was determined that only 16 inches from each lower edge had tar paper/mastic with some asbestos content.

Atlantic Abatement quickly designed an abatement plan and worked closely with the Department of Health and our contractor, to complete the abatement work quickly and efficiently.

It was a pleasure working with Atlantic Abatement during this project. We had not expected to find this problem when we began this project. Atlantic Abatement knew exactly what needed to be done and was extremely professional.

Sincerely,

Rev. Richard A. Valentine
